

SokaSoko — REFEREE My CV + Rating Test Script (Internal)

Version 1.0 · Internal QA

What you're testing

The REFEREE branch of the My CV screen and the aggregate rating chip on the profile card. Backend serves GET /v1/matches/refereeing/:userId with each COMPLETED match populated (homeTeam, awayTeam, venue, tournament), myRole tag, and a per-match rating aggregate ({averageRating, gamesRated}) computed via a single MongoDB \$group query. The profile card fetches the aggregate via GET /v1/referee-ratings/referee/:refereedId.

Prerequisites

- Android device on the latest internal-testing build.
- A REFEREE test account with COMPLETED matches spanning at least two roles (main + assistant) and at least one match that has been rated (RefereeRating collection).
- A second REFEREE account with ZERO matches for the empty-state case.
- Backend + Mobile access to inspect responses.

Environment

- Backend: <https://sokasoko.onrender.com>. Verify GET /v1/matches/refereeing/ returns 200 with rating field on rated matches.
- Backend commit: 903820e or later on main.
- Mobile: sokasoko-mobile commit b931b9b or later.
- Endpoint reused: GET /v1/referee-ratings/referee/:refereedId (existing, unchanged).

Test cases

1. GET /v1/matches/refereeing/:userId — shape

- curl the endpoint with a REFEREE userId.

Expected: 200 with data:[] of Match documents. Each has homeTeam, awayTeam, venue (populated with name, region, district, ward), tournament, matchId, scheduledDate, myRole ('REFEREE' | 'ASSISTANT_1' | 'ASSISTANT_2'), and rating either {averageRating:number, gamesRated:number} or null. Only status=COMPLETED matches appear. Sort: scheduledDate DESC.

2. myRole correctness

- Verify myRole matches the ref's actual slot in each row.

Expected: If ref is match.referee → myRole='REFEREE'. If match.assistantReferee1 → 'ASSISTANT_1'. If assistantReferee2 → 'ASSISTANT_2'. Client uses this string to render the role badge — no client-side inference.

3. Per-match rating aggregate

- Verify the rating field for a match that has 2 rating rows (3 and 5 stars).
- Verify the rating field for a match with 0 rating rows.

Expected: Rated match: rating={averageRating:4, gamesRated:2}. averageRating is rounded to 1 decimal. Unrated match: rating=null (client hides the badge). Aggregate is scoped to this specific ref+match — a match rated for a DIFFERENT ref does not leak into this response.

4. Aggregate rating on profile card

- Log in as REFEREE with rated matches, open Profile.

Expected: Above the avatar, an amber pill '■ N.N / 5.0 · mechi X' appears. Data source: GET /v1/referee-ratings/referee/:refereeld → averageRating + gamesRated. For a REFEREE with 0 ratings: pill shows 'Bado hakuna makadirio' with white/grey styling.

5. Non-referee accounts unaffected

- Log in as PLAYER, open MyCv.
- Log in as SCOUT, open Profile.

Expected: PLAYER MyCv shows the existing Cv entries with the Create FAB — no regression. SCOUT profile card has NO rating pill above the avatar (only REFEREE gates the chip).

6. Empty-state referee

- Fresh REFEREE with 0 completed matches.

Expected: MyCv shows centred text 'Hakuna mechi ulizoongoza bado.' Profile shows the empty-state pill. GET /v1/matches/refereeing/ returns data:[].

7. Foreign-user view

- Open a REFEREE's profile from someone else's account.
- Tap through to their MyCv (widget.id != null path).

Expected: MyCv fetches the target user's type first (via currentUser({userId})), then correctly routes to the referee list. Create FAB is not rendered (widget.id != null OR isRefereeView both hide it).

8. Enrichment uses one round trip

- Watch Render logs while opening MyCv on a REFEREE with 20+ matches.

Expected: Only one aggregate query hits the RefereeRating collection (via \$group). No N+1 pattern. Enrichment failure is best-effort — swallows and returns rating:null on all rows if aggregation errors.

9. Overflow / typography

- Narrow device (Pixel 4a).

Expected: Team names truncate with ellipsis at maxLines:2. Role badge and rating badge sit on the same row via Spacer without overlap. Rating badge fits on one line (■ 4.5 · 3').

10. Rating updates propagate

- As a coach, submit a new RefereeRating for a match.
- Reopen the referee's MyCv.

Expected: New average and count reflect the new rating on that match card. Profile pill also updates on next profile open (setUser refetches).

How to report a bug

Field	Example
Test case #	3 — rating aggregate wrong
Device / OS	Pixel 6a · Android 14
App version	1.0.1+14
Backend commit	903820e
Account (type + number)	REFEREE · TFH-R-A000012
Endpoint (if backend)	GET /v1/matches/refereeing/<uid>

Expected	rating={averageRating:4, gamesRated:2}
Actual	rating={averageRating:2.5, gamesRated:1}
Screenshot / repro	attached
Render log excerpt	attached

Known limitations (not bugs)

- Only COMPLETED matches appear on the CV. In-progress or cancelled matches are hidden by design.
- Per-match rating aggregate lumps all coaches together — no filtering by rater type.
- Rating aggregate on the profile is fetched once on profile mount; it does not live-update. Pull-to-refresh on the profile screen (if wired) would fix.
- Foreign-user MyCv still routes correctly, but the aggregate rating on THEIR profile card is only fetched when the current user is a REFEREE (own-profile only). Foreign REFEREE profile cards do not yet fetch the aggregate.
- Backend enrichment is best-effort — if the aggregate query throws, rating fields are all null; frontend falls back to hiding the badge instead of surfacing an error.
