

SokaSoko — Clinic MVP Test Script (Internal)

Version 1.0 · Internal QA

What you're testing

The Football Clinic MVP built against the SokaSoko_Clinic_Field_Spec. Clinics share the Trial collection with an eventType='CLINIC' discriminator; existing trials were pre-migrated to eventType='TRIAL' and legacy endpoints are scoped so clinics never leak into trial listings. Tier gate: canPostClinics=true on COACH/ACADEMY/CLUB Gold+ and VENDOR Platinum+ (delegation-aware). Enrol enforces guardian consent + medical declaration + identity docs and stores everything on the shared TrialRegistration with attendance + safeguarding sub-schemas.

Prerequisites

- Backend commit 2f90b2d or later on main (multipart enrol landed).
- Mobile commit 2764bf3 or later.
- Backfill script scripts/backfill-trial-type.js has run against prod (verified on 2026-08-11).
- Multiple test accounts: qualifying COACH/ACADEMY/CLUB/VENDOR + one non-qualifying + one PLAYER for enrolment.
- S3 or local-disk upload working (AWS creds — check with /medias POST first if unsure).

Environment

- Backend: <https://sokasoko.onrender.com>.
- New endpoints under /v1/clinics/.*
- FEATURE_CAPS.canPostClinics flag on 8 tier entries; anywhere else → false.
- All Trial + TrialRegistration writes now stamp eventType.

Test cases

1. GET /v1/clinics — shape + scoping

- curl /v1/clinics?limit=5 as any user.
- curl /v1/trials?limit=5 to confirm clinics don't leak.

Expected: Clinics endpoint returns rows with eventType='CLINIC'. Trials endpoint filters to eventType='TRIAL' and shows only legacy trials. Cross-contamination = fail.

2. POST /v1/clinics — tier gate (denied)

- As COACH STANDARD, POST /v1/clinics with a full body.

Expected: 403 with reason=COACH_CLINIC_CREATION_BLOCKED (or similar prefixed with actual user type).

3. POST /v1/clinics — tier gate (allowed)

- As COACH GOLD, POST /v1/clinics with { title, organizer=self, startDate, location, gender, focusArea }.

Expected: 201 with created clinic. eventType='CLINIC' by default. requiresGuardianConsent and requiresMedicalDeclaration default to true if omitted.

4. Delegation — Academy Coach staff can post

- Guardian G is ACTIVE staff at Academy A with role=COACH.
- G POSTs /v1/clinics with organizer=.

Expected: 201 accepted. Subscription.getEffectiveContext resolves G's context to ACADEMY tier=A's actual tier, and caps.canPostClinics flows from there.

5. Session auto-numbering

- POST a clinic with sessions:[{date:'2026-09-01'}, {date:'2026-09-08'}].

Expected: Response has sessions[0].sessionNumber=1 and sessions[1].sessionNumber=2 (auto-assigned by the router).

6. Add session post-creation

- POST /v1/clinics/:id/sessions with {date, topic}.

Expected: 201 with the new session object; sessionNumber = existing count + 1.

7. Mark session complete

- PATCH /v1/clinics/:id/sessions/:sessionId with {status:'Completed', completedBy:}.

Expected: Session status='Completed', completedAt=now, completedBy set. Subsequent attendance/notes on that session should proceed normally.

8. Enrol — mandatory identity docs

- POST /v1/clinics/:id/enrol without dobDocument or passportPhoto.

Expected: 400 with reason=IDENTITY_DOCS_REQUIRED. No TrialRegistration created.

9. Enrol — mandatory guardian consent when required

- POST /v1/clinics/:id/enrol with dobDocument+passportPhoto but guardianConsent.given=false, on a clinic where requiresGuardianConsent=true.

Expected: 400 with reason=GUARDIAN_CONSENT_REQUIRED.

10. Enrol — mandatory medical declaration when required

- POST enrol without medicalDeclaration on a clinic that requires it.

Expected: 400 with reason=MEDICAL_DECLARATION_REQUIRED.

11. Enrol — multipart happy path

- POST /v1/clinics/:id/enrol as multipart with fields: playerId, dobDocument (file), passportPhoto (file), medicalDeclaration (file), guardianConsent (JSON string with given:true, guardianName, phone, relationship), emergencyContact (JSON string).

Expected: 201 with new TrialRegistration. dobDocument/passportPhoto/medicalDeclarationUrl on the doc are URL strings. guardianConsent.givenAt is now. status='pending'.

12. Enrol — JSON callers still work

- POST as JSON with URL strings for dobDocument/passportPhoto/medicalDeclarationUrl (pre-uploaded).

Expected: 201 same as multipart. Middleware early-returns when no files.

13. Duplicate enrol

- POST enrol twice for the same player on the same clinic.

Expected: Second call returns 409 (unique index on trialId+playerId).

14. Attendance bulk write

- POST /v1/clinics/:id/sessions/:sid/attendance with entries=[{registrationId, status:'PRESENT'}, {registrationId, status:'LATE'}, ...] and markedBy.

Expected: Response { updated: N }. Each registration's attendance[] array is upserted with the session's record (session, sessionNumber, sessionDate, status, note, markedBy, markedAt). Re-running with same registrationId replaces the record, not appends.

15. Session note

- POST /v1/clinics/:id/sessions/:sid/notes with player, coach, workedOn, coachRating, effort, note.

Expected: 201 with { line }. The line is appended to that player's registration.notes as a plain-text audit trail (a dedicated ClinicAssessment collection is Phase 2).

16. Organizer registrations view

- GET /v1/clinics/:id/registrations.

Expected: Array of registrations with populated playerId (firstName, lastName, dob, gender, accountNumber, profileImage) sorted newest first.

17. GET /v1/clinics/:id populated

- GET /v1/clinics/:id where the clinic has staff and a venue on a session.

Expected: Response populates organizer, leadCoach, staff.coach (nested), and sessions.venue (name, region, district, ward).

18. Legacy trial endpoints unaffected

- As an ACADEMY, POST /v1/trials with a normal trial body.
- GET /v1/trials/my/:userId as the same academy.

Expected: Trial created with eventType='TRIAL' (schema default). Listings scoped to eventType='TRIAL' so the new clinic doesn't appear. Existing trial data surfaces normally.

19. Mobile — feed FAB gating

- Log in as each account type, open Profile → Clinics.

Expected: COACH/ACADEMY/CLUB/VENDOR see the 'Post Clinic' FAB.
PLAYER/REFEREE/SCOUT/AGENT/GUARDIAN don't. (Backend still authoritative on POST.)

20. Mobile — Enrol sheet keyboard behaviour

- Trigger EnrolClinicSheet on a small device, fill the guardian phone field.

Expected: Sheet scrolls (SingleChildScrollView with viewInsets padding). No bottom overflow error even with keyboard open.

How to report a bug

Field	Example
Test case #	11 — Enrol multipart happy path
Device / OS	Pixel 6a · Android 14
App version	1.0.1+14
Backend commit	2f90b2d
Account	PLAYER · TFH-P-A000006
Endpoint	POST /v1/clinics/:id/enrol
Expected	201 with TrialRegistration and 3 doc URLs

Actual	500 with InvalidAccessKeyId (S3)
Screenshot / repro	attached
Render log excerpt	attached

Known limitations (not bugs)

- Doc uploads route through the shared uploader — if S3 creds are invalid the enrol POST 500s. Same underlying dependency as profile image uploads.
- Staff invitations for clinic staff[] are backend-only for now — no in-app picker.
- Add-session UI on mobile is deferred; use PATCH /v1/clinics/:id/sessions or POST /v1/clinics/:id/sessions for now.
- Session notes accept a lightweight per-player audit line but there's no coach UI yet — Phase 2 will introduce ClinicAssessment.
- Certificate generation, ClinicAssessment (baseline/exit trajectory), payments, and the recommend-for-trial bridge are Phase 2/3 per the spec.
- Rate-of-completion on session PATCH doesn't cascade to registration.attendance yet — a coach still needs to mark attendance explicitly per session.
