

SokaSoko — Referee Crew Rating Test Script (Internal)

Version 1.0 · Internal QA

What you're testing

The rewritten referee-crew rating flow on the match-detail screen. Backend now allows any homeCoach / awayCoach OR homeTeam / awayTeam user id to submit ratings. Compound unique index is now {match, ratedBy, referee}, so one caller can submit up to three ratings on a single match (head ref + both assistants), one per official. Mobile widget renders a stacked card with per-official star selectors and Submit buttons. Aggregate ratings feed through to the CV badge and profile pill.

Prerequisites

- Android device on the latest internal build.
- A team-owner account (ACADEMY / CLUB / SCHOOL) OR a coach that is registered as homeCoach/awayCoach on a completed match.
- A COMPLETED match with at least one head referee assigned; ideally with assistantReferee1 and assistantReferee2 also assigned.
- Ability to log in as a REFEREE (any of the three officials on the match) to verify the aggregate flow-through.
- Render logs + MongoDB access for backend verification.

Environment

- Backend: <https://sokasoko.onrender.com> — commit c2b80b5 or later on main.
- IMPORTANT: the migration script `scripts/fix-rating-index.js` has been run once against production (drops the stale {match, ratedBy} unique index). Re-verify the collection's indexes if 409 conflicts start firing unexpectedly.
- Mobile: sokasoko-mobile commit 8853c63 or later.
- New index: {match: 1, ratedBy: 1, referee: 1} unique.

Test cases

1. Backend eligibility broadened

- As a team-owner user (homeTeam id), POST `/v1/referee-ratings` with valid matchId + refereeld + stars.
- As a homeCoach user, do the same.
- As an unrelated user (not on the match at all), attempt the POST.

Expected: Team-owner: 201 rating created. Coach: 201 rating created. Unrelated user: 403 with 'Only the match coaches or team owners can rate the referee crew'.

2. refereeld validation

- POST a rating with refereeld that is NOT one of match.referee / assistantReferee1 / assistantReferee2.

Expected: 400 with 'refereeld was not officiating this match'. Guards against a coach smuggling a rating for someone else.

3. Compound unique index — one rating per (match, caller, official)

- As a coach, submit a rating for the head referee (5 stars).
- As the same coach, submit a rating for assistantReferee1 (3 stars).
- As the same coach, submit a rating for assistantReferee2 (4 stars).
- Try to submit a second rating for the head referee (2 stars).

Expected: First three: all 201. Fourth: 409 with 'You have already rated this official for this match'. Index {match: 1, ratedBy: 1, referee: 1} enforces this exactly.

4. /check returns array of the caller's ratings

- GET /v1/referee-ratings/check?matchId=&ratedBy;=
- GET /v1/referee-ratings/check?matchId=&ratedBy;=&referee;=

Expected: First: { ratings: [3 rows], rating: null, exists: true }. Second: { ratings: [1 row for that referee], rating: , exists: true }. Legacy consumers that pass referee still get the singular field.

5. Mobile — crew card presence + rows

- As a team owner, open a COMPLETED match with all three referee slots filled.

Expected: Purple 'Kadiria waamuzi · Rate the crew' card renders below match info. Three sub-sections in order: Mwamuzi Mkuu, Msaidizi 1, Msaidizi 2. Each has name, role label, 5-star tap row, and Tuma button. If a slot is empty on the match, that sub-section is skipped.

6. Mobile — independent state per official

- Tap 4 stars on Mwamuzi Mkuu, 3 stars on Msaidizi 1, 5 stars on Msaidizi 2. Do NOT submit yet.
- Now tap Tuma on Msaidizi 1 only.

Expected: Only Msaidizi 1 submits. The other two rows retain their un-submitted star selections until the widget rebuilds. Post-submit, Msaidizi 1 row shows 'Imetumwa' badge and stars become read-only.

7. Aggregate flow-through to match rating badge

- After submitting a rating on a match, open /v1/matches/refereeing/ for the rated referee.

Expected: That match row now has rating: {averageRating: , gamesRated: 1}. If multiple coaches submit ratings on the same official for the same match, averageRating is the mean, gamesRated is the total number of coach ratings.

8. Aggregate flow-through to profile pill

- Open profile of a REFEREE who has been rated on at least one match.

Expected: Above the avatar, ■ N.N / 5.0 · mechi N pill renders with amber background. For a REFEREE with zero ratings, the pill shows 'Bado hakuna makadirio' in grey. Refreshes on next profile mount (setUser call).

9. Aggregate flow-through to My CV

- As the rated REFEREE, open My CV.

Expected: The specific match card now shows an amber ■ N.N · N badge on the right side. Matches without ratings continue to hide the badge.

10. Gate — no card for non-team users

- Open the same match's detail screen as a PLAYER, SCOUT, GUARDIAN, or admin.

Expected: Rate-the-crew card does NOT render (widget.visible = false). Existing 'Ratings' read-only summary panel remains visible to everyone.

11. Duplicate-rating error surfacing

- Submit a rating, then use the app to try again on the same official.

Expected: Stars are read-only post-submit (no client-side retry path). If a manual curl POST triggers the 409, the client's error snack reads 'Haikuweza kutuma. Jaribu tena.' — the specific error body is not surfaced.

How to report a bug

Field	Example
Test case #	3 — compound unique index
Device / OS	Pixel 6a · Android 14
App version	1.0.1+14
Backend commit	c2b80b5
Account (type + number)	ACADEMY · TFH-A-A000005
Endpoint (if backend)	POST /v1/referee-ratings
Expected	201 for each of head+asst1+asst2, 409 on repeat
Actual	409 on assistant rating attempt (stale index)
Screenshot / repro	attached
Render log excerpt	attached

Known limitations (not bugs)

- Post-submit ratings cannot be edited or deleted from the mobile UI. If a coach mis-clicks, they need admin intervention (or manual DB deletion) to redo.
- Card shown only for COMPLETED matches. Rating during ONGOING is not permitted.
- The Ratings history read-only summary still populates from the /match/:id endpoint (unchanged) — verify all three officials' rows appear correctly there after backend deploy.
- No client-side error copy differentiates 403 (not eligible) from 409 (already rated) — both surface the generic 'Haikuweza kutuma' snack.
- The check endpoint's response shape changed (adds `ratings` array); any other client consuming just `rating` should still work via the referee query param.
